

§10.3 Polar Coordinates

<p>POLAR COORDINATE SYSTEM</p>	<p>...is a coordinate system with its origin at a pole O and a polar axis from which we measure the polar angle. In this system a point P is represented by a pair of numbers (r, θ) where:</p> <p>r - radius, distance from the pole O to the point P</p> <p>θ - polar angle, angle between the polar axis and the line OP</p> <p>Note: positive angle is measured in <i>counterclockwise</i> direction from the polar axis</p> 
<p>COORDINATES OF THE POLE</p>	<p>For the pole $r = 0$, so the pole is represented by the point $(0, \theta)$, for any value of θ.</p>
<p>NEGATIVE RADIUS r</p>	<p>The points (r, θ) and $(-r, \theta)$ lie on the same line through O and have the same distance r from O, but they are located on the opposite sides of O. Hence</p> <ul style="list-style-type: none"> ▫ $r > 0$ means the point (r, θ) lies in the same quadrant as θ ▫ $r < 0$ means the point (r, θ) lies in the quadrant on opposite side of the pole O
<p>NOTATION</p>	<p>$(r, \theta) = (r, \theta + 2n\pi) = (-r, \theta + (2n+1)\pi)$</p>
<p>CARTESIAN AND POLAR COORDINATES</p>	<p>To obtain the Cartesian coordinates from polar coordinates:</p> <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 10px auto;"> $\begin{aligned} x &= r \cos \theta \\ y &= r \sin \theta \end{aligned}$ </div> <p>To obtain polar coordinates from Cartesian coordinates:</p> <div style="border: 1px solid black; padding: 5px; width: fit-content; margin: 10px auto;"> $\begin{aligned} r &= \sqrt{x^2 + y^2} \\ \tan \theta &= \frac{y}{x} \end{aligned}$ </div> 
<p>POLAR CURVE</p>	<p>Equation of a polar curve (polar equation): $r = f(\theta)$ or $F(r, \theta) = 0$</p>
<p>SYMMETRY</p>	<p>If a polar equation does not change when:</p> <ul style="list-style-type: none"> ▫ θ is replaced by $-\theta$, the curve is symmetric about the <u>polar axis</u> ▫ r is replaced by $-r$ or if θ is replaced by $\theta + \pi$, the curve is symmetric about the <u>pole</u> ▫ θ is replaced by $\pi - \theta$ <u>vertical line</u> $\theta = \pi/2$
<p>TANGENTS TO POLAR CURVES</p>	<p>To find a tangent line to a polar curve $r = f(\theta)$, write its parametric equations as</p> $x = r \cos \theta = f(\theta) \cos \theta \quad \text{and} \quad y = r \sin \theta = f(\theta) \sin \theta$ <p>Then</p> <div style="border: 1px solid black; padding: 10px; width: fit-content; margin: 10px auto;"> $\frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{\frac{dr}{d\theta} \cdot \sin \theta + r \cos \theta}{\frac{dr}{d\theta} \cdot \cos \theta - r \sin \theta}$ </div> <p>Horizontal tangents: $dy/d\theta = 0$, provided that $dx/d\theta \neq 0$</p> <p>Vertical tangents: $dx/d\theta = 0$, provided that $dy/d\theta \neq 0$.</p>
